

Iterator and Comparator and Wrapper Classes Assignment

1. Create a Student class with fields: id, name, age, marks.
 - Store at least 5 students in a `List<Student>`.
 - Sort by:
 - Name (alphabetically)
 - Marks (descending)
 - Age (ascending)
 - Use different `Comparator` implementations for each.
 - Sort students:
 - First by marks descending.
 - If marks are equal, then by name ascending.
 - Use **Comparator chaining** (`Comparator .thenComparing()`).
 - Sort a list of integers in **descending order** using an **anonymous Comparator** (without a separate class)
2. Given a list of `Employee` objects, remove those who have salary < 30000 using `Iterator`.
3. Convert: `int`, `double`, `char`, and `boolean` to their respective wrapper classes. Print the class name of each.
4. Create a `Map<String, Integer>` of product names and their prices. Iterate through entries using `Iterator<Map.Entry<...>>` and print key-value pairs.

CHOCOLATE PROBLEM

Employee Processing:

- Create Employee class with id, name, department, and salary.
- Add 10 employees to a list.
- Use Comparator to sort by salary.
- Use Iterator to remove employees from the "HR" department.
- Use wrapper types to:
 - Parse salary from string.
 - Store employee IDs as Integer.
